For almost 20 years a quiet but ominous fear has haunted the corridors of the Central Intelligence Agency: the specter of a mole — an American official, some where in the upper echelons of the CIA who is really a Soviet agent planted by its own spy network, the KGB. In the words of a CIA insider, "there is a mole inside the CIA hierarchy; this means that every particle of our intelligence is suspect and possibly contaminated. It means the Soviets have detailed knowledge of our verification capability and can circumvent it, changing the world power balance."

Three years ago, a widespread CIA search intensified for a mole who might conceivably be operating his own spy ring within the Agency. This followed a series of arrests of several former CIA employees who admitted having passed intelligence secrets to the Soviets. Many of these secrets concerned clandestine electronic and satellite surveillance systems the U.S. was using to monitor Russian strategic weapons developments. Loss of those secrets was termed by the CIA the most serious espionage disaster in 20 years.

Then, in late September, a CIA official whose very secrets disabused one calm body of John Arthur Paisley, Deputy Director of Strategic Research. At first, the CIA claimed Paisley was a "stove" matter, a simple, as it were, working one, routine, with a very limited information disappearance. The cover-up dissolved. John Paisley, it turned out, had unlimited quarters and his information. One he was working a secret report about capabilities. The CIA finally admitted Paisley was a brilliant Agency operative who had never been involved in any clandestine intelligence activities, and no credible evidence existed to suspect

Some say John Paisley was a
top Russian spy planted in the CIA.
Some say he was both.
Some say John Paisley was a brilliant
